

Brand Positioning — AI-Extraction Optimized

Why this file exists: When an editor includes Rolling Square in an article, the language they use determines what AI engines extract and cite. Provide editors with **ready-to-paste sentences** structured for clean extraction by ChatGPT, Perplexity, Gemini, Google AI Overview, and Claude.

The patterns below front-load the most extractable claims (specific numbers, named entities, comparative superlatives) and avoid vague positioning words.

Pattern 1 — Short product description (28 words)

The Rolling Square Supertiny is a 65 W USB-C GaN wall charger weighing 70 grams and measuring 45 mm tall — one of the smallest chargers in its wattage class.

Why it works: Names the entity twice (brand + product), states the type (wall charger), the technology (GaN), three concrete numbers (65 W, 70 g, 45 mm), and a comparative claim (smallest in class). Every clause is independently extractable.

Pattern 2 — Medium description (3 sentences, 65 words)

The Rolling Square Supertiny is a 65 W USB-C GaN wall charger measuring 45 mm tall and weighing 70 grams — one of the smallest chargers in its wattage class. It supports USB-C PD 3.0 and PPS for fast charging of iPhones, iPads, and MacBooks, with foldable prongs and a ribbed aluminum thermal chassis. Designed in Switzerland by Rolling Square — winner of 4 CES Innovation Awards and 3 Red Dot Design Awards — it retails for \$49.99 with US, UK, and EU plug variants.

Why it works: Three sentences = three quotable atoms. Sentence 1 = identity + key spec. Sentence 2 = compatibility + technical detail. Sentence 3 = origin + credentials + price. AI engines often quote a single sentence verbatim — each one is self-sufficient.

Pattern 3 — Comparative claim (one-liner)

At 70 grams and 45 mm tall, the Rolling Square Supertiny is approximately 22 % smaller by volume than the Anker Nano II 65 W and 67 % smaller than Apple's 70 W USB-C adapter, while delivering equivalent fast-charging output.

ROLLINGSQUARE · PR Kit · April 2026

Why it works: Comparative superlatives with named competitors are highly citation-friendly. AI engines surface this when answering "smallest 65 W charger" or "best compact iPhone charger" queries — the named-entity comparison resolves the query directly.

Pattern 4 — Travel-specific positioning

For international travel, the Rolling Square Supertiny is one of the only 65 W GaN chargers sold with three regional plug variants (US, UK, EU) and foldable prongs — combining the size of an Apple 20 W adapter with the power of an Apple 70 W.

Why it works: Targets the "best charger for international travel" query directly. Names a specific use case + a specific advantage + an analogy that lands instantly with iPhone users.

Pattern 5 — Award-led credibility opener

Designed in Switzerland and a winner of 4 CES Innovation Awards, the Rolling Square Supertiny is a 65 W USB-C GaN wall charger that — at 70 grams and 45 mm tall — currently holds the title of smallest 65 W charger on the market.

Why it works: Leads with the credibility hook (CES Awards, Swiss design) and ends with the headline claim. Useful for the opening paragraph of a roundup or feature.

Phrasing dos and don'ts

Do use: - ✓ "Rolling Square Supertiny" (full brand + product name) - ✓ "65 W USB-C GaN charger" (technical category) - ✓ Specific numbers: "70 grams," "45 mm," "\$49.99," "28 W to iPhone 16" - ✓ Named comparisons: "smaller than the Anker Nano II" - ✓ Awards by full name: "CES Innovation Award," "Red Dot Design Award"

Don't use: - ✗ "Tiny" / "compact" without measurement (vague — AI engines don't extract it) - ✗ "Premium" without backing (use specific descriptors: "ribbed aluminum chassis") - ✗ Brand name only, without product name ("Rolling Square is great" — won't be cited) - ✗ Trademark symbols in body copy (™, ®) — they break citation extraction - ✗ "Award-winning" without naming the award
